

# Head lice

## About head lice infestation

Having head lice is not harmful to health. Head lice are only able to live on humans. They are usually passed on by head-to-head contact; brief hair contact is enough. In contrast to popular belief, head lice are not able to fly or jump, but they do use their six legs to grip hair firmly. Head lice suck blood every two to three hours; this is what causes the irritation. When separated from their human hosts, head lice die within twenty four hours.

## What causes head lice?

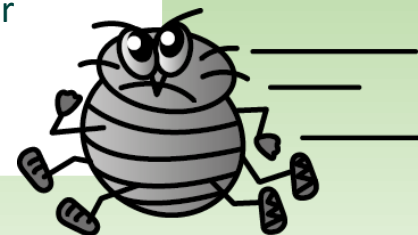

Head lice are contagious. You can become infected with head lice when the insects crawl onto your head. Lice can be transferred by touching your head to an infected person's head, sharing the personal items of someone with head lice, using a fabric item after an infected person.

Head lice can live for up to 24 hours when separated from humans (on upholstered furniture, bedding, towels, clothing, etc).

## Why Picksan?

- Natural formula; does not contain insecticides
- Suitable for asthma sufferers & children from 2 years old
- Non Flammable
- Odourless
- Paraben free and SLES free
- Lice can develop resistance to chemical products. However, it is more difficult for them to develop resistance to natural products such as Picksan

## Effective & easy to use

PIP Code: 366-7656

Item Code: DSH110

- Removes all lice using natural active ingredients
- No insecticides
- Scientifically proven to be effective
- Cares for hair, leaves it soft and manageable
- Kind to the hair and scalp
- Makes combing easy
- Dermatologically tested
- Contains Mel-Aza extract

Prof. Mehlhorn's  
PICKSAN®  
**NO  
lice!**

PIP Code: 366-7649  
Item Code: DSH112

## Prevents head lice and nit infestation

- Based on natural repellents which some plants possess
- Easy to apply, spray on hair, hats, coats etc.
- Odourless to humans and mild on the skin
- Scientifically proven to be effective
- Protects for at least 7 hours
- Dermatologically tested
- No insecticides
